No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                          **SIDS1/gcgdata/geneseq/geneseqn-emb1/NA1980.DAT:*

This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (I) a mucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in sommatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA polymerase and formulations comprising it - allowing the amplification of sequences up to 35 kilobases and reducing the mutagenicity generated by the PCR process.
                                                                                                                                                                                                                                                                                                                                                                  AAGGAAAGCGGCCGCTCATTATTTGATTTCAATTTTGTCC 40

The formilation of DNA polymerases is used in polymerase chain reactions specific oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Improved polymerase chain reaction method utilizing 2 thermostable DNA polymerases either having or lacking 3'-exonuclease activity and derived from Pyrococcus furiosus, Thermotoga maritime, Thermococcus licoralis and Thermus aquaticus -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

A group of these probes may be attached on cells which form part of a single chip. The oligonucleotides to be detected are labelled and are complementary to the set of capture probes used. The detection chip may be used to detect a number of different polynucleotides

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising readom portions of a genome. ACC44612 to ACC44732 and ABP96650 to ABP96657 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plant artificial chromosome, PAC; transgenic plant; vaccine;

.1345 /\*tag= \*tag= \*tag= Rat cryptdin 2 gene. WO9616075-A1 05-OCT-1995; 10-MAY-1996 Rattus sp. AAT30737; intron Key noxe AAT3073 8 The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods insertion of heterologous DNA into plant artificial chromosome (PAC) is useful for producing a transgenic plant chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, FNRA, rDNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (YAC). This producing plant artificial chromosomes of the invention. plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic Immediate early gene; IEG; neuron; brain; function; growth factor; transcription factor; signal transduction; cytoskeletal protein; metabolic enzyme; learning; memory; synaptic transmission; tolerance; neuronal plasticity; ds. Novel genes and polypeptides, useful for treating conditions related to a deficiency in nIEG responsiveness to a stimulus

```
This sequence represents rat neuronal immediate early gene (IEG) cDNA clone R280. An IEG is a gene whose expression is rapidly clonemediately following a stimulus e.g., neuronal stimulation. Such neuronal IEGs have been found to encode a variety of proteins, con neuronal IEGs have been found to encode a variety of proteins, including transcription factors, cytoskeletal proteins, growth factors and metabolic enzymes, as well as proteins involved in signal transduction. The identification of neuronal IEGs and the proteins they encode may provide important information about the function of neurons in, for example, learning, memory, synaptic transmission, tolerance and neuronal plasticity. Neuronal IEGs neuronal IEG protein products, calls expressing neuronal IEGs and antibodies against neuronal IEG creteins can be used to treat an animal with a deficiency in neuronal IEG can be used to treat an animal with a deficiency in neuronal IEG can be used to treat an animal with a stimulus comprises a maximal electroconvulsive selfcers may be a reduced or elevated level of expression of an IEG. The neuronal stimulus comprises a maximal electroconvulsive selfaure and its effects influence learning or memory. The IEGs and protein products are useful in identifying compounds that modulate the expression or activity of IEG nucleic acids or proteins, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New tissue-specific promoters from Beta vulgaris, useful e.g. for altering carbohydrate metabolism, express transgenes selectively in
                                                                                                                                                     The rat cryptdin-2 gene (T30737) codes for the precursor (R98787) of cryptdin-2 (R98792), an antimicrobial peptide that exhibits activity against a broad range of intestinal and opportunistic pathogens. Rat cryptdin-1, -2, and -3 genes (see also T30736 and T30738) were isolated from a Sprague-Dawley genomic library cloned in EMBL3. The cryptdin-2 gene, or corresponding cDNA (see also T30734), can be used to produce large amounts of cryptdin-2 for use in treating inflammatory pathologies of the intestine.

                                                                   The invention relates to a promoter (A) that is: (i) any of the sequences ABN81281-ABN81284; (ii) the complement of (i); or (iii) a sequence that hybridises to (ii). (A) are used, specifically in Beta vulgaris, to control expression of transgenes, particularly to alter carbohydrate metabolism; reduce loss of storage substances; express invertase inhibitor, fructosyl transferase, levan sucrase or genes that encode transporter proteins for nitrogen compounds, or increase resistance to, or tolerance of, pathogens. (A) provide tissue-specific transgene expression, either in roots or above-ground parts, so avoid pleiotropic effects, e.g. when expressing invertase inhibitor.
                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This DNA fragment obtainable from Arabidopsis thaliana is capable of promoting root knot and cyst nematode-inducible transcription of an associated DNA sequence when reintroduced into a plant. The promoterless GUS construct binary vector pMOGS53 was mobilised by triparental mating to Agrobacterium tumefaciens MOGIO1 and the resulting strain was used for Arabidopsis root transformation. Line pMOGS53#25 was identified as a line which showed strong GUS

expression inside syncytia and giant cells induced by the cyst nematode Heterodera schachtii and the root knot nematode Meloidogyne incognita, respectively. Promoter tags from line pMGS53#25 were sequenced. The claimed DNA fragment is nematode feeding of stee-specific. Also claimed DNA fragment is nematode feeding of above sequence capable of promoting root knot and cyst nematode inducible transcription of an associated DNA sequence comprising a DNA fragment as above plus a DNA sequence which is not naturally under its transcriptional control, and which causes the production of a plant cell-disruptive substance, preferably barnase; (3) a plant cell-disruptive substance, preferably barnase; (4) a replicon comprising the chimeric DNA sequence of (2), or the above DNA and at least I restriction endonuclease recognition site; (4) a microorganism containing the replicon of (3); (5) a plant cell and consisting of the cells of (5), preferably a dicotyledonous plant, ceppecially a potato plant; (8) a plant grafted onto the root system of a plant of a plant, selected from seeds, flowers, tubers, consisting of the cells of (5), preferably a dicotyledonous plant, (6) a part of a plant, selected from seeds, flowers, tubers, crocts, leaves, fruits, pollen and wood, obtained from the plant of the DNA fragment can be used to identify subfragments capable of crocts, leaves, fruits, pollen and wood, obtained from the plant.

CT or (8), and (10) a crop consisting of the plants capable of crocts, leaves, fruits, pollen and wood, obtained from the plant.

CT can also be used for making hybrid regulatory DNA sequences. The chimeric DNA sequence of (2) can be used for transforming claimed and the cells of consisting the plants of capacities and be used for transforming consisting can be used to reduce the cells of capacities of capacities and be used for transforming capable of capacities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MCP-6 zymogen, mouse, mast cell protease 6; mMCP-7; tryptase-7; blood clot; anticoagulant; myocardial infarction; reocclusion; thromboembolism; cerebral embolism; thrombosis; therapy; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This nucleotide sequence includes a coding region for mouse mast cell protease 6 (mMCP-6, see AAW64242). The invention provides: compositions comprising an isolated tryptase-7 (such as mMCP-7, see AAW64231), a method for treating a blood clot by administering a nucleic acid molecule that codes for a tryptase-7, or an expression product; a nucleic acid encoding a serine protease (SP); and a method of producing a mature SP. Tryptase-7 polypeptides can be used for treating disorders mediated by undesirable thrombus clot formation and amyocardial infarction and recorlusion following thromboembolism, deep vein thrombosis, cerebral embolism, renal
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compositions containing tryptase-7, e.g. mouse mast cell protease-7 - are used to treat clot formation in e.g. myocardial infarction, reocclusion following angioplasty or pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ·

one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (1) a platform artificial chromosome expression system (ACes) (1) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome. (1) can be used in gene therapy. (M1) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid molecule fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous making a library of ACes comprising random portions of a genome. ACC44612 exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plant artificial chromosome; PAC; transgenic plant; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                    This represents the cDNA sequence of the mouse mast cell protease (mMCD-6). The invention provides sequences shown in AAW63160 to AAW63169 that are inhibitors of mMCP-6. These peptides which are tryptasse-6 complex inhibitors, can be used for treating a mast cell-mediated inflammatory disorder. The inhibitors can be used to treat inflammatory disorders including asthma, allergic rhinitis, urticaria and anticedema, eczematous dermatitis (atopic dermatitis), hyperproliferative skin disease, anaphylaxis, peptic ulcers, inflammatory bowel disorder, hyperresponsiveness and inflammatory skin conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chromosome-based platform; artificial chromosome; eukaryotic chromosome; att site; integrase; recombinase; ACes; gene therapy; transgenic animal; platform artificial chromosome expression system; gene; ds.

```

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial drivomosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, FNRA, rbNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and proteins, and proteins, antigens, hormones, cytokines, growth factors, antigens, hormones, cytokines, growth factors, antigens, hormones, cytokines, growth factors, antigens, nature and plant artificial nutrient use and/or improves the nutrient quality of the plant. The nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid growth in a bacterial artificial cherented and or improves the nutrient quality of the plant. The heterologous nucleic acid growth a bacterial artificial chromosome (YAC) or a yeast artificial chromosome (YAC). This polynucleotide sequence represents the DNA of a plasmid used in the Score 25; DB 25; Length 4346; Pred. No. 3.9; Sequence 4346 BP; 1022 A; 1208 C; 1094 G; 1022 T; 0 other; chromosome (BAC) or a yeast artificial method of the invention

New synthetic variants of spider dragline protein - for making

```
This sequence represents the complete nucleotide sequence of the plasmid was used in the construction of the vector pFP510 which was used to express synthetic spider dragiline variants, DP-1A.9 and DP-1B.9 pAJ26i comprises a replication origin active in E. coli, a selectable genetic marker which is a gene conferring resistance to a melectable genetic marker which is a gene conferring resistance to consistent in sites for the restriction endouncleases Bamil and BglII with no essential sequences between them, and a third restriction site for peri, located within the selectable marker which produces cohesive ends incompatible with those produced by Bamil and BglII. The polypeptide incompatible with those produced by Bamil and BglII. The polypeptide mornmers are variants based on a consensus sequence derived from the fibre forming regions of goider dragiline protein, esp. the natural protein and the pattern of variation among individual repeats. Of the natural protein and the pattern of variation among individual repeats. DP-1A analogues are composed of a tandemly repeated 101 amino acid monomer which comprises four repeats which differ from the consensus componer which comprises four repeats which differ from the consensus (1) the polyvalanine sequence varies in length from 0-7 residues; (2) when the entire poly-alanine sequence; is deleted, consensus integral multiples of three consecutive residues; (3) aside from the polyvalanine sequence, deletions usually encompass integral multiples of three consecutive residues; (1) the polymalanine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The proteins may be used to produce fibres of high tensile strength elasticity, suitable for clothing, rope, surgical sutures, biomateri for implants, plastic reinforcements, films, coatings, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ,

Sequence 69, Application US/09015968
Patent No. 6057425
Harin No. 6057425
TERRAL INFORMATION:
APPLICANT: Selsted, Michael E.
APPLICANT: Ouellette, Andre J.
TITLE OF INVENTION: Antibiotic Cryptdin Peptides and Methods
TITLE OF INVENTION: Of Their Use
NUMBER OF SEQUENCES: 70
CORRESPONDENCE ADDRESS:
ADDRESSEE: Campbell and Flores
STREET: 4370 La Jolla Village Drive, Suite 700
CITY: San Diego
STATE: California
Sequence 2007. Application US/08342268

Sequence No. 5844072

Patent No. 5968782
GENERAL INFORTION:
APPLICANT: Stevens, Richard L.
TITLE OF INVENTION: MAST CELL PROTEASE THAT CLEAVES
TITLE OF INVENTION: FIBRINOGEN
NUMBER OF SEQUENCES: 74
CORRESPONDENCE ADDRESS:
ADDRESSEE: Wolf, Greenfield & Sacks, P.C.
                                              GENERAL NO. 3202431
GENERAL NO. 3202431
APPLICANT: Stevens, Richard L.
APPLICANT: Huang, Chifu
TITLE OF INVENTION: MAST CELL PROTEASE PEPTIDE
TITLE OF INVENTION: INHIBITORS
NUMBER OF SEQUENCES: 65
CORRESPONDENCE ADDRESS:
ADDRESSES: ANDIT OF SECUENCES: 65
CONTEXT: 600 Atlantic Avenue

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 2,

/none_lib="tradiated amplea Zap; Seedlings were exposed either
to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation.
Gamma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni-Zap XR vector (Stratagene) and
packaged using the Gigapack III Gold packaging extracts.
Phagemids containing cDNA inserts were in vivo excised
from the recombinant Uni-Zap XR vector using ExAssist
helper phage and the E. coli strain XII-Blue MRF'
(Stratagene). Excised plasmids were plated using SOLR

//dow gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation.
Gamma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni-Zap XR vector (Stratagene) and
packaged using the Giappack III Gold packaging extracts.
Phagemids containing cDNA inserts were in vivo excised
from the recombinant Uni-Zap XR vector using ExAssist
helper phage and the E. coli strain XL1-Blue MRF,
//dow stragene). Excised plasmids were plated using SOLR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BQ156182

/note="Vector: Lambda Uni-ZAP XR, excised phagemid pBluescript SK; Site_1: EcoRI; Site_2: XhoI; Plants were grown in the greenhouse. Spikes were sprayed at anthesis with Fusarium graminearum. Total RNA, and poly(A) RNA were prepared and pooled from infected spike at 0, 6, 12, 24, 36 and 48 hours after inoculation, a CDNA library was made, and the CDNA clones were in vivo excised to give pBluescript phagemids in G. Muchlbauer lab at the University of Minnesota (Kruger, W.M., Muchlbauer, G.U., Pritsch, C., Vance, C.). The CDNA library should contain genes of both wheat and fungal pathogen origin. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

Sequences have been trimmed to remove vector sequence and low quality sequence with phred score less than 20. No effort was taken to identify ESTs of fungal origin from this library, thus this EST seq primer: Stratagene SK primer.
                                                                             Triticum aestivum (bread wheat)
Triticum aestivum

/note="Vector: Lambda Zap; Seedlings were exposed either
to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation.
Gamma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni-Zap XR vector (Stratagene) and
packaged using the Gigapack III Gold packaging extracts.
Phagemids containing cDNA inserts were in vivo excised
from the recombinant Uni-Zap XR vector using ExAssist
helper phage and the E. coll strain XII-Blue MRF'
(Stratagene). Excised plasmids were plated using SOLR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /dev stage="seedings" / dev surface: Lambda 229; Seedings were exposed either to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation. Gamma-irradiated samples were harvested at 6, 12, 24 and 48 hours after treatment. UV-irradiated samples were harvested 24 hours post-treatment. CDNA was prepared from polyA+ enriched, pooled samples of equivalent amounts of total RNA from each sample. The cDNA was directionally ligated into the Uni-Zap XR vector (Stratagene) and packaged using the Gigapack III Gold packaging extracts. Phagemids containing cDNA inserts were in vivo excised from the recombinant Uni-Zap XR vector using ExAssist helper phage and the E. coll strain XLI-Blue MRF. (Stratagene). Excised plasmids were plated using SOLR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            473 bp mRNA linear EST 24-APR-2002

Cloning and sequencing of Plasmodium falciparum DNA fragments
containing repetitive regions potentially coding for histidine-rich
proteins: identification of two overlapping reading frames
Blochem. Blophys. Res. Commun. 146 (1), 368-377 (1987)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /codon start=1

48 hours after treatment. UV-irradiated samples were harvested 24 hours post-treatment. CDNA was prepared from poly4+ enriched, pooled samples of equivalent amounts of total RNA from each sample. The CDNA was directionally ligated into the Uni-Zap XR vector (Stratagene) and packaged using the Gigapack III Gold packaging extracts. Phagemids containing cDNA inserts were in vivo excised from the recombinant Uni-Zap XR vector using ExAssist helper phage and the E. coli strain XII-Blue MRF' (Stratagene). Excised plasmids were plated using SOLR

damma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni-Zap XR vector (Stratagene) and
packaged using the Gigapack III Gold packaging extracts.
Phagemids containing cDNA inserts were in vivo excised
from the recombinant Uni-Zap XR vector using ExAssist
helper phage and the E. coll strain XLI-Blue MRF'
(Stratagene) Excised plasmids were plated using SOLR
